Caring for Feet with Charcot-Marie-Tooth Syndrome

Brief Overview

Charcot-Marie-Tooth Disease (CMT) is an inherited disorder that affects the nerves outside the brain and spinal cord called peripheral nerves.

There are different types of CMT. Some cause damage to the covering that protects nerve fibers (myelin sheaths). Other types of CMT damage the nerve fibers directly. In both cases, neuropathy results from the damaged nerve fibers.

The longest peripheral nerves, in the arms and legs, are affected first. Both nerve fibers that create movement and transmit sensations are affected.

Weakness and numbness are typically noticed in the feet first as a result. The feet are further affected by various symptoms

associated with CMT including:

- arched Very high feet causing a foot deformity;
- An inability to hold the foot horizontal, called foot drop;
- When walking, feet can slap on the floor due to foot drop;
- Numbness in the feet;
- Difficulty with balance.

Important	Foot	Care
Measures		

Because CMT greatly affects the feet, appropriate footwear and foot care are necessary interventions. Due to the lack of sensation and movement in the feet, they are very vulnerable to further complications.

Therefore. the following safety assessment and measures highly are recommended:

Doh!

In February we had 9 patients that failed to attend their appointment!

Fit feet for active lifestyles

Caring for Feet with Charcot-Marie-Tooth Syndrome (Cont'd from previous page)

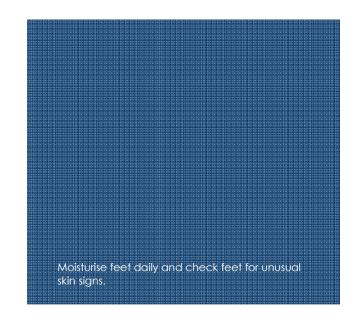

- Orthopaedic shoes may be necessary to provide proper fitting. Experience in fitting shoes for complex feet, becomes important. Sometimes, custom (casted) orthotic inserts are prescribed.
- Podiatrists may liaise with pedorthists if a custom or customised shoe is needed.
- Patients with CMT should have nails trimmed or calluses removed by podiatrists to prevent further complications, such as

tissue injury or infection.

- After walking barefoot, a thorough inspection should be done on the toes and bottoms of your feet.
- Avoid open toed shoes or heels and wearing the same shoes two days in a row.

- Gently break in new shoes, wearing them only a few hours at first to prevent sore spots and blisters. Feet should be inspected for red areas that can indicate too much pressure.
- Check the inside of your shoes daily for foreign objects or sharp edges.
- When soaking your feet, be cautious of too much moisture between the toes and monitor for signs of athlete's foot. Remember to thoroughly dry in between all toes.
- Ask for advice about what moisturizer is suitable for <u>your</u> feet.
- Always have loose, peeling or unusual looking skin checked and evaluated.

Caring for Feet with Charcot-Marie-Tooth Syndrome

(Cont'd from previous page)

- Keep feet dry natural fibre (cotton) socks are generally good, though will take longer to dry out than synthetic blends ("wicking") socks. Our advice; wear natural fibres but change socks through the day as needed.
- Change your socks and inspect them for

blood, stains or other drainage that may indicate an open sore that you were unaware of.

It is very important that you examine your feet daily, including in between your toes. Challenging spots can be viewed with a mirror or you can have a friend or family member do the assessment.

If any redness, sores, cuts, pus, swelling, or blisters are found you need to make an appointment with your podiatrist right away, even if you have no pain.

The loss of sensation and movement in the feet make patients with CMT more prone to sores, injury, and infection. Taking necessary care of your feet on a daily basis is the key prevention for further foot-related complications. ♦
